6 Months Training TR-104 Full Stack Development

February, 2026

Day 1 – Project Overview and System Architecture

1. Objective of the Day

The objective of the day was to understand the overall project structure and analyze the system architecture involving Angular frontend and Firebase backend.

2. Tasks Performed

- Studied the complete working flow of the application
- Understood how the Angular frontend interacts with backend services
- Analyzed the role of Firebase as backend for authentication and data storage
- Explored the overall system flow from user input to backend processing
- Identified key components involved in the application
- Understood modular structure separating authentication and other features
- Analyzed how different parts of the system are interconnected

3. Tools / Technologies Used

- Angular Framework
- Firebase
- TypeScript

4. Key Learnings

- Modern applications follow a frontend-backend architecture
- Angular handles user interface and interaction
- Firebase provides backend services such as authentication and database

- Modular structure improves scalability and maintainability
- System flow follows: User Input → Frontend → Backend → Response

5. Challenges Faced

- Understanding complete system flow at initial stage
- Relating frontend actions with backend processes

6. Solutions

- Broke down the system into smaller parts
- Studied flow step-by-step for better clarity

7. Conclusion

- Successfully understood overall project architecture
- Gained clarity on how Angular and Firebase work together
