Day 19 – Authentication Feature Completion and Password Recovery Implementation

1. Objective of the Day

The objective of the day was to complete the authentication module by implementing password recovery functionality and ensuring all authentication features work cohesively.

2. Tasks Performed

- Reviewed complete authentication flow (login, logout, guards, dashboard access)
- Ensured proper integration of authentication service across components
- Created a dedicated “Forgot Password” component
- Designed a reactive form to capture registered user email
- Implemented password reset functionality using Firebase authentication
- Triggered password reset emails for registered users
- Displayed appropriate success and error messages
- Handled invalid email and edge cases
- Managed form submission state to prevent duplicate requests
- Verified navigation between login and forgot password pages
- Ensured consistency in UI behavior across authentication features

3. Tools / Technologies Used

- Angular Framework

- Firebase Authentication
- Reactive Forms
- TypeScript

4. Key Learnings

- Authentication systems must handle complete user lifecycle
- Password recovery is a critical feature in real-world applications
- Proper integration ensures smooth user experience
- Handling edge cases improves system reliability

5. Challenges Faced

- Ensuring smooth integration of password recovery with existing authentication flow
- Managing different user scenarios and validation cases

6. Solutions

- Tested multiple user flows and edge cases
- Refined UI and validation handling

7. Conclusion

- Successfully completed the authentication module with password recovery
- Achieved a fully functional authentication system
