Day 20 – Authentication Testing, Session Persistence, and Token Management

1. Objective of the Day

The objective of the day was to test the complete authentication system and understand how authentication sessions and tokens are managed within the application.

2. Tasks Performed

- Performed end-to-end testing of the authentication system
- Verified login, logout, and route protection behavior
- Tested password recovery functionality completely
- Checked authentication persistence across page reloads
- Observed user session behavior after refresh
- Analyzed how authentication state is restored automatically
- Studied token generation during login
- Understood how tokens are stored securely in the browser
- Observed automatic token refresh mechanism
- Verified token removal and session termination on logout
- Tested application behavior after session expiration

3. Tools / Technologies Used

- Angular Framework

- Firebase Authentication
- Web Browser

4. Key Learnings

- Authentication state persists until explicitly cleared
- Tokens are responsible for maintaining secure sessions
- Session management is critical for application security
- Proper testing ensures reliability of authentication systems

5. Challenges Faced

- Understanding internal working of session persistence and tokens

6. Solutions

- Repeated testing and observation of authentication behavior

7. Conclusion

- Successfully validated complete authentication workflow
- Gained strong understanding of session and token management
