6 Months Training TR-104 Full Stack Development

February, 2026

Day 11 – Authentication Session Persistence

1. Objective of the Day

The objective of the day was to understand how authentication sessions are maintained and how users remain logged in across application reloads.

2. Tasks Performed

- Studied how Firebase maintains user authentication sessions
- Observed user login state after refreshing the application
- Analyzed how authentication state is restored automatically
- Tested session persistence across multiple reloads
- Verified that users remain logged in until logout
- Understood how Firebase stores session information
- Observed impact of session persistence on UI behavior
- Ensured proper synchronization between authentication state and UI

3. Tools / Technologies Used

- Angular Framework
- Firebase Authentication
- AngularFire
- Web Browser

4. Key Learnings

- Firebase maintains authentication sessions automatically

- Users remain logged in until they explicitly sign out
- Session persistence improves user experience
- UI should reflect current authentication state at all times
- Authentication state is restored on application reload

5. Challenges Faced

- Understanding how session persistence works internally
- Observing state changes across reloads

6. Solutions

- Tested multiple scenarios involving login and refresh
- Analyzed authentication behavior step-by-step

7. Conclusion

- Successfully understood authentication session persistence
- Verified stable user session behavior
