February, 2026

Day 12 – Access Control and Authorization Handling

1. Objective of the Day

The objective of the day was to control user access within the application and implement authorization logic based on authentication status.

2. Tasks Performed

- Implemented logic to restrict access to protected routes
- Ensured only authenticated users can access certain pages
- Redirected unauthorized users to login page
- Controlled navigation based on authentication state
- Managed user access to different parts of the application
- Verified route protection during login and logout
- Tested application behavior for authorized and unauthorized users
- Ensured consistent enforcement of access rules

3. Tools / Technologies Used

- Angular Framework
- Angular Routing
- Firebase Authentication
- TypeScript

4. Key Learnings

- Access control is essential for application security

- Only authenticated users should access protected routes
- Authorization ensures proper user navigation
- Authentication state drives access decisions
- Secure routing improves application reliability

5. Challenges Faced

- Ensuring correct restriction of routes
- Handling unauthorized access scenarios

6. Solutions

- Tested multiple access scenarios
- Refined routing logic for proper control

7. Conclusion

- Successfully implemented access control mechanisms
- Strengthened application security and navigation flow
