6 Months Training TR-104 Full Stack Development

February, 2026

Day 14 – Firestore Introduction and Database Structure

1. Objective of the Day

The objective of the day was to understand Firestore as a database service and explore how application data is structured and stored.

2. Tasks Performed

- Studied Firestore as a NoSQL cloud database
- Understood the concept of collections and documents
- Explored how data is organized in Firestore
- Analyzed how user and application data can be stored
- Reviewed Firestore console and data structure
- Studied integration of Firestore with Angular application
- Understood how Firestore supports real-time data updates

3. Tools / Technologies Used

- Firebase Firestore
- Angular Framework
- AngularFire
- Web Browser

4. Key Learnings

- Firestore stores data in collections and documents
- It is a NoSQL database designed for scalability

- Firestore supports real-time data synchronization
- Data structure should be planned carefully for efficiency
- Firestore integrates seamlessly with Angular applications

5. Challenges Faced

- Understanding NoSQL data structure
- Mapping application data to Firestore format

6. Solutions

- Studied examples of collections and documents
- Analyzed sample data structures

7. Conclusion

- Gained clear understanding of Firestore database structure
- Prepared for data storage implementation
