6 Months Training TR-104 Full Stack Development

February, 2026

Day 15 – Storing User Data in Firestore

1. Objective of the Day

The objective of the day was to integrate Firestore with the authentication system and store user-related data in the database.

2. Tasks Performed

- Connected Firestore with the Angular application using AngularFire
- Designed data structure for storing user information
- Linked authentication data with Firestore database
- Stored user details such as email and user ID in Firestore
- Implemented data writing operations to create new documents
- Ensured data is stored correctly after user signup
- Verified database entries through Firestore console
- Handled data structure consistency

3. Tools / Technologies Used

- Angular Framework
- Firebase Firestore
- AngularFire
- TypeScript

4. Key Learnings

- Firestore can store application data alongside authentication

- User data can be linked with authentication IDs
- Proper data structure ensures efficient storage and retrieval
- AngularFire simplifies Firestore operations
- Data verification is important after storage

5. Challenges Faced

- Mapping authentication data to Firestore structure
- Ensuring correct data storage format

6. Solutions

- Tested data writing with different scenarios
- Verified entries in Firestore console

7. Conclusion

- Successfully stored user data in Firestore
- Integrated database functionality with authentication system
