Day 16 – Firestore Debugging and Data Handling Issues

1. Objective of the Day

The objective of the day was to identify and resolve issues related to Firestore integration and ensure proper data handling within the application.

2. Tasks Performed

- Identified issues in data storage and retrieval from Firestore
- Debugged problems related to incorrect data mapping
- Resolved errors in Firestore configuration
- Fixed issues related to asynchronous data operations
- Ensured correct linking between authentication and database entries
- Tested data flow between Angular and Firestore
- Verified successful storage and retrieval after debugging
- Improved reliability of database operations

3. Tools / Technologies Used

- Angular Framework
- Firebase Firestore
- AngularFire
- TypeScript

4. Key Learnings

- Debugging is essential for stable database integration

- Asynchronous operations must be handled carefully
- Proper configuration ensures smooth data flow
- Testing helps identify hidden issues
- Data consistency is critical for application reliability

5. Challenges Faced

- Handling asynchronous Firestore operations
- Identifying root cause of data issues

6. Solutions

- Used step-by-step debugging approach
- Tested each operation individually

7. Conclusion

- Successfully resolved Firestore-related issues
- Improved stability of database operations
