Day 17 – Data Retrieval and Display from Firestore

1. Objective of the Day

The objective of the day was to retrieve stored data from Firestore and display it dynamically in the Angular application.

2. Tasks Performed

- Implemented data retrieval from Firestore collections
- Fetched user-related data using AngularFire services
- Handled asynchronous data fetching
- Displayed retrieved data in the UI using Angular components
- Bound Firestore data to templates for dynamic rendering
- Ensured real-time updates are reflected in the UI
- Verified correctness of retrieved data
- Tested data flow between Firestore and frontend

3. Tools / Technologies Used

- Angular Framework
- Firebase Firestore
- AngularFire
- TypeScript

4. Key Learnings

- Firestore allows real-time data retrieval

- Angular can dynamically render data from backend
- Asynchronous data handling is essential
- Data binding connects backend data with UI
- Real-time updates improve user experience

5. Challenges Faced

- Handling asynchronous data correctly
- Ensuring correct rendering of dynamic data

6. Solutions

- Used proper data subscription methods
- Tested data retrieval with different scenarios

7. Conclusion

- Successfully retrieved and displayed Firestore data
- Established dynamic data flow between backend and frontend
