6 Months Training TR-104 Full Stack Development

February, 2026

Day 18 – Full System Flow Integration

1. Objective of the Day

The objective of the day was to integrate all components of the application and verify the complete system workflow from user input to data storage and retrieval.

2. Tasks Performed

- Integrated authentication and Firestore modules
- Verified complete flow: User Input → Angular → Firebase Authentication → Firestore
- Tested signup, login, and data storage processes together
- Ensured correct data flow across all modules
- Verified UI updates based on backend operations
- Tested interaction between authentication and database
- Identified and fixed minor integration issues
- Ensured smooth communication between all system components

3. Tools / Technologies Used

- Angular Framework
- Firebase Authentication
- Firebase Firestore
- AngularFire
- TypeScript

4. Key Learnings

- Integration connects all parts of the application
- End-to-end flow is essential for real-world applications
- Authentication and database must work together seamlessly
- Testing ensures proper system behavior
- Modular design simplifies integration

5. Challenges Faced

- Ensuring smooth interaction between modules
- Managing complete data flow across the system

6. Solutions

- Tested system step-by-step
- Fixed integration issues during testing

7. Conclusion

- Successfully integrated complete application workflow
- Verified end-to-end system functionality
