6 Months Training TR-104 Full Stack Development

February, 2026

Day 19 – Application Testing and System Validation

1. Objective of the Day

The objective of the day was to perform comprehensive testing of the entire application and validate all functionalities across authentication and database integration.

2. Tasks Performed

- Performed end-to-end testing of the application workflow
- Tested signup, login, and Google authentication functionalities
- Verified Firestore data storage and retrieval
- Checked integration between authentication and database modules
- Tested route access and navigation behavior
- Identified inconsistencies and minor issues in the system
- Validated UI behavior across different scenarios
- Ensured proper error handling throughout the application
- Re-tested features after fixing identified issues

3. Tools / Technologies Used

- Angular Framework
- Firebase Authentication
- Firebase Firestore
- AngularFire

- Web Browser

4. Key Learnings

- Comprehensive testing ensures system reliability
- End-to-end validation confirms proper integration
- Error handling is critical for smooth application behavior
- Testing helps identify real-world issues
- Stability depends on consistent system behavior

5. Challenges Faced

- Identifying edge cases in integrated system
- Ensuring consistency across multiple features

6. Solutions

- Tested application under different scenarios
- Fixed issues and revalidated functionality

7. Conclusion

- Successfully validated complete application workflow
- Ensured stable and reliable system performance
