6 Months Training TR-104 Full Stack Development

February, 2026

Day 20 – System Stability and Final Integration Refinement

1. Objective of the Day

The objective of the day was to improve system stability by refining integration, optimizing application behavior, and ensuring smooth end-to-end performance.

2. Tasks Performed

- Refined integration between Angular, Firebase Authentication, and Firestore
- Optimized data flow between frontend and backend
- Improved UI responsiveness based on backend operations
- Ensured consistent behavior across all application modules
- Fixed minor performance and synchronization issues
- Verified smooth navigation across application routes
- Ensured proper session handling during continuous usage
- Conducted final system checks for stability and reliability

3. Tools / Technologies Used

- Angular Framework
- Firebase Authentication
- Firebase Firestore
- AngularFire
- TypeScript

4. Key Learnings

- Stability is essential for production-level applications
- Proper integration ensures smooth user experience
- Optimization improves application performance
- Continuous testing enhances reliability
- System refinement is necessary after development

5. Challenges Faced

- Ensuring consistent performance across all modules
- Handling minor integration and synchronization issues

6. Solutions

- Performed repeated testing and refinements
- Improved code and data flow for better performance

7. Conclusion

- Successfully refined and stabilized the application
- Achieved a smooth and fully functional system
