Day 7 – Login Flow Implementation

1. Objective of the Day

The objective of the day was to implement the user login functionality and understand how Firebase validates user credentials during authentication.

2. Tasks Performed

- Designed the login form with email and password fields
- Implemented the form using Angular Reactive Forms
- Captured user credentials through form controls
- Connected the login form with Firebase authentication service
- Implemented login using Firebase signInWithEmailAndPassword method
- Handled authentication responses for successful login
- Displayed error messages for invalid credentials
- Redirected users to the application after successful login
- Ensured proper validation before form submission

3. Tools / Technologies Used

- Angular Framework
- Firebase Authentication
- AngularFire
- Reactive Forms

- TypeScript

4. Key Learnings

- Login process validates user credentials against stored data
- Firebase handles authentication securely
- Reactive Forms help manage login flow efficiently
- Proper error handling improves user experience
- Authentication success leads to controlled navigation

5. Challenges Faced

- Handling login errors such as incorrect credentials
- Managing authentication response flow

6. Solutions

- Implemented structured error handling
- Tested multiple login scenarios

7. Conclusion

- Successfully implemented user login functionality
- Established secure authentication using Firebase
