6 Months Training TR-104 Full Stack Development

February, 2026

Day 8 – Authentication State Management and UI Behavior

1. Objective of the Day

The objective of the day was to understand how authentication state is managed and how the user interface reacts based on login status.

2. Tasks Performed

- Studied how Firebase maintains authentication state
- Tracked user login status within the application
- Implemented logic to detect authenticated users
- Updated UI dynamically based on authentication state
- Displayed different UI elements for logged-in and logged-out users
- Controlled navigation based on authentication status
- Tested application behavior after login and logout
- Ensured consistent UI updates based on user state

3. Tools / Technologies Used

- Angular Framework
- Firebase Authentication
- AngularFire
- TypeScript

4. Key Learnings

- Authentication state determines user access and UI behavior

- Firebase maintains user session automatically
- UI should respond dynamically to authentication changes
- State management is essential for user experience
- Proper handling ensures secure and responsive applications

5. Challenges Faced

- Understanding how authentication state is tracked
- Synchronizing UI updates with authentication changes

6. Solutions

- Observed authentication flow through testing
- Implemented conditional rendering based on state

7. Conclusion

- Successfully implemented authentication state handling
- Improved UI responsiveness based on user login status
