Day 15 – Lazy Loading and Feature Routing in Angular

1. Objective of the Day

The objective of the day was to improve application performance and structure by implementing lazy loading and configuring feature-level routing in Angular.

2. Tasks Performed

- Studied the concept of lazy loading in Angular
- Implemented lazy loading using loadChildren with dynamic imports
- Created feature modules for authentication and dashboard
- Configured routing using RouterModule.forRoot() and RouterModule.forChild()
- Implemented feature-level routing modules
- Verified that modules load only when their routes are accessed
- Resolved routing issues such as blank page errors
- Tested navigation across different routes

3. Tools / Technologies Used

- Angular Framework
- TypeScript
- Angular Routing

4. Key Learnings

- Lazy loading improves application performance
- Feature modules help organize large applications

- RouterModule.forRoot() is used in root module
- RouterModule.forChild() is used in feature modules
- Proper routing configuration is essential for navigation

5. Challenges Faced

- Errors due to incorrect routing configuration
- Difficulty in understanding routing hierarchy

6. Solutions

- Debugged routing issues step-by-step
- Corrected module imports and routing setup

7. Conclusion

- Successfully implemented lazy loading and feature routing
- Improved application structure and performance
