Day 17 – Authentication Error Handling and UI Behavior

1. Objective of the Day

The objective of the day was to improve the authentication system by handling errors effectively and enhancing user interface behavior during authentication processes.

2. Tasks Performed

- Handled Firebase authentication errors during sign-in and sign-up
- Displayed meaningful error messages for invalid credentials
- Managed errors such as invalid email, weak password, and existing user
- Implemented UI feedback for authentication failures
- Reset loading states when authentication failed
- Displayed loading indicators during authentication requests
- Disabled buttons during form submission to prevent multiple requests
- Improved navigation between sign-in and sign-up pages
- Enhanced overall user experience during authentication

3. Tools / Technologies Used

- Angular Framework
- Firebase Authentication
- Reactive Forms
- TypeScript

4. Key Learnings

- Proper error handling improves application reliability
- User-friendly error messages enhance usability
- UI feedback is important during asynchronous operations
- Managing loading states prevents unwanted user actions
- Authentication flow should be smooth and responsive

5. Challenges Faced

- Handling different types of authentication errors
- Managing UI state during asynchronous operations

6. Solutions

- Implemented structured error handling logic
- Used conditional rendering to display appropriate messages

7. Conclusion

- Successfully improved authentication error handling
- Enhanced UI behavior and user experience
