

6 Months Training TR-104 Full Stack Development

May, 2026

Day 6 – Performance Optimization and Code Refinement

1. Objective of the Day

The objective of the day was to optimize application performance and improve code quality.

2. Tasks Performed

- Reviewed application performance across major modules
- Verified lazy-loaded modules and routing behavior
- Optimized data retrieval operations from Firestore
- Removed unnecessary code and redundant logic
- Improved component structure and maintainability
- Reduced unnecessary data processing operations
- Performed performance validation after optimizations

3. Tools / Technologies Used

- Angular Framework
- Firebase Firestore
- AngularFire

4. Key Learnings

- Performance optimization improves user experience
- Code cleanup enhances maintainability
- Efficient data retrieval reduces resource consumption
- Modular architecture supports scalability

- Continuous optimization improves long-term project quality

5. Challenges Faced

- Identifying inefficient code sections
- Maintaining functionality while optimizing performance

6. Solutions

- Reviewed application behavior systematically
- Validated each optimization after implementation

7. Conclusion

- Successfully optimized application performance
- Improved maintainability and efficiency of the codebase
