

6 Months Training TR-104 Full Stack Development

May, 2026

Day 7 – Security Validation and Access Control Testing

1. Objective of the Day

The objective of the day was to validate application security and verify access control mechanisms.

2. Tasks Performed

- Reviewed Firestore security rules implementation
- Tested user-specific data access restrictions
- Verified role-based permissions for shared notes
- Checked route protection and authentication behavior
- Tested unauthorized access scenarios
- Ensured proper protection of user data
- Documented security observations and improvements

3. Tools / Technologies Used

- Angular Framework
- Firebase Firestore
- Firebase Authentication

4. Key Learnings

- Security validation is essential before deployment
- Access control protects sensitive user information
- Authentication and authorization must work together

- Security testing helps identify vulnerabilities
- Proper rule configuration improves data protection

5. Challenges Faced

- Testing various access-control scenarios
- Verifying security behavior across different user roles

6. Solutions

- Conducted role-based testing using multiple accounts
- Validated security rules against expected behavior

7. Conclusion

- Successfully validated application security mechanisms
- Ensured proper access control and data protection
