

6 Months Training TR-104 Full Stack Development

May, 2026

Day 9 – Application Deployment and Verification

1. Objective of the Day

The objective of the day was to deploy the application and verify its functionality in the deployment environment.

2. Tasks Performed

- Configured Firebase Hosting for deployment
- Generated production build of the Angular application
- Deployed the application to Firebase Hosting
- Verified accessibility of the deployed application
- Tested major application features after deployment
- Checked authentication and Firestore connectivity
- Validated overall application stability in the deployed environment

3. Tools / Technologies Used

- Angular Framework
- Firebase Hosting
- Firebase Firestore

4. Key Learnings

- Deployment is a crucial stage of application development
- Production environments require additional validation
- Hosting services simplify application deployment

- Post-deployment testing ensures reliability
- Successful deployment completes the development lifecycle

5. Challenges Faced

- Verifying deployment configurations correctly
- Ensuring all services function after deployment

6. Solutions

- Performed deployment validation systematically
- Tested all critical application modules after deployment

7. Conclusion

- Successfully deployed the CollabNest application
- Verified functionality and stability after deployment
