Day 10 – Module Interaction, Component Visibility, and Debugging

1. Objective of the Day

The objective was to understand how components interact across modules, manage component visibility, and develop debugging skills for resolving Angular errors.

2. Tasks Performed

- Studied component-module relationship in Angular
- Learned that each component belongs to a single module
- Understood private and public components in modules
- Exported components to make them accessible across modules
- Imported feature modules into root module
- Implemented component composition using selectors in templates
- Created and used nested components within templates
- Practiced debugging common Angular errors
- Resolved errors related to missing exports and incorrect module configuration
- Analyzed Angular compiler and runtime error messages

3. Tools / Technologies Used

- Angular Framework
- TypeScript
- HTML

4. Key Learnings

- Components are private to their module by default
- Export is required to share components across modules
- Modules control component visibility and scope
- Components interact through templates, not TypeScript imports
- Debugging is an essential skill in Angular development

5. Challenges Faced

- Errors related to module visibility and missing exports
- Difficulty in understanding Angular error messages

6. Solutions

- Carefully analyzed error messages
- Corrected module imports and exports step-by-step

7. Conclusion

- Successfully implemented module interaction and component sharing
- Improved debugging skills and error-handling confidence
