Day 6 – Computed Signals, Object Handling, and Routing Basics

1. Objective of the Day

The objective was to understand advanced state management using computed signals, work with object-based data, and gain a conceptual understanding of Angular routing.

2. Tasks Performed

- Introduced computed signals for deriving values from existing signals
- Created computed values to simplify template logic
- Accessed and displayed object-based data in templates
- Worked with nested object properties using signals
- Practiced updating objects immutably
- Applied conditional styling based on application state
- Studied the concept of Angular routing
- Understood the purpose of router-outlet
- Learned how Angular switches components based on URL

3. Tools / Technologies Used

- Angular Framework
- TypeScript
- HTML & CSS

4. Key Learnings

- Computed signals help derive and manage dependent data
- They automatically update when base signals change
- Objects must be updated immutably for proper reactivity
- Angular separates UI rendering from application logic
- Routing enables navigation without page reload

5. Challenges Faced

- Understanding computed signals and their read-only nature
- Handling object updates while maintaining immutability

6. Solutions

- Practiced creating and updating computed signals
- Followed immutability principles while modifying objects

7. Conclusion

- Successfully implemented computed signals and object handling
- Gained foundational understanding of Angular routing
