6 Months Training TR-104 Full Stack Development

January, 2026

Day 9 – Angular NgModule Architecture and Application Structure

1. Objective of the Day

The objective of the day was to understand the NgModule-based architecture in Angular and learn how applications are structured using modules and components.

2. Tasks Performed

- Set up an Angular project using NgModule-based architecture
- Configured application bootstrapping using AppModule
- Studied the role of main.ts as the application entry point
- Created and configured the root module (AppModule)
- Introduced a feature module (BooksModule)
- Understood how modules organize application structure
- Learned how components are declared within modules
- Studied module-based component visibility rules

3. Tools / Technologies Used

- Angular Framework
- TypeScript
- HTML

4. Key Learnings

- Angular applications can be structured using NgModules
- AppModule acts as the root module of the application

- main.ts is the entry point of Angular applications
- Modules help organize and scale applications
- Components must be declared within a module

5. Challenges Faced

- Understanding NgModule-based architecture compared to standalone approach
- Managing module configuration correctly

6. Solutions

- Practiced creating and configuring modules step-by-step
- Referred to examples to understand module hierarchy

7. Conclusion

- Successfully understood Angular application structure using NgModules
- Built a strong foundation for modular application development
