6 Months Training TR-104 Full Stack Development

March, 2026

Day 2 – Admin Panel Component Planning and Setup

1. Objective of the Day

The objective of the day was to identify, plan, and set up the required components for the admin panel to manage users and projects effectively.

2. Tasks Performed

- Identified core admin panel components: User List, Add User, Project List, and Add Project
- Created these components using Angular CLI
- Organized components within a dedicated admin module
- Planned routing structure for admin panel navigation
- Defined the purpose and functionality of each component
- Ensured proper modular separation of admin-related features
- Reviewed folder structure for better maintainability

3. Tools / Technologies Used

- Angular Framework
- Angular CLI
- TypeScript

4. Key Learnings

- Proper planning of components simplifies development process
- Modular architecture improves scalability and organization

- Each component should have a single responsibility
- Angular CLI helps in quick and structured component creation
- Routing plays a key role in navigation within admin panel

5. Challenges Faced

- Structuring components in a logical and scalable way
- Deciding clear responsibilities for each component

6. Solutions

- Followed modular design principles for organizing components
- Clearly defined functionality for each component before implementation

7. Conclusion

- Successfully planned and created the admin panel component structure
- Established a clean and scalable foundation for further development
