# 6 Months Training TR-104 Full Stack Development

## March, 2026

## Day 4 – Add User Component Implementation

### 1. Objective of the Day

The objective of the day was to implement the Add User component to allow the admin to create and store new users in the system.

### 2. Tasks Performed

- Designed the Add User form with required input fields
- Implemented the form using Angular Reactive Forms
- Captured user details such as email and role
- Applied validation rules for required fields and correct input format
- Connected the form with Firestore for storing user data
- Added new user entries to the database
- Displayed confirmation messages after successful user creation
- Tested the functionality with multiple input cases

### 3. Tools / Technologies Used

- Angular Framework
- Firebase Firestore
- AngularFire
- Reactive Forms
- TypeScript

**4. Key Learnings**

- Forms are essential for structured data input
- Validation ensures correctness of user data
- Firestore allows dynamic addition of records
- Admin panel enables centralized user management
- Proper form handling improves user experience

**5. Challenges Faced**

- Handling form validation and ensuring correct input format
- Managing data storage and confirming successful database updates

**6. Solutions**

- Applied built-in validators in Reactive Forms
- Verified database entries after each form submission

**7. Conclusion**

- Successfully implemented Add User functionality
- Enabled admin to create and store new users in the system
