Day 5 – Project List Component Implementation

1. Objective of the Day

The objective of the day was to implement the Project List component to display all projects in the admin panel and understand how project data is managed.

2. Tasks Performed

- Designed the UI layout for displaying project details
- Connected the component with Firestore to fetch project data
- Retrieved list of projects stored in the database
- Displayed project details such as project name, description, and assigned user
- Implemented dynamic rendering of project data using Angular
- Ensured proper mapping between projects and users
- Tested project list functionality with sample data

3. Tools / Technologies Used

- Angular Framework
- Firebase Firestore
- AngularFire
- TypeScript

4. Key Learnings

- Project data must be properly linked with users
- Firestore enables structured storage and retrieval of project data

- Dynamic UI rendering helps display real-time project information
- Proper data mapping is essential for admin functionalities
- Organized display improves clarity and usability

5. Challenges Faced

- Mapping project data correctly with respective users
- Handling asynchronous retrieval of project data

6. Solutions

- Structured Firestore data with proper user references
- Used Angular data binding and subscriptions for proper rendering

7. Conclusion

- Successfully implemented Project List component
- Enabled admin to view all projects with correct user mapping
