Day 6 – Add Project Component Implementation

1. Objective of the Day

The objective of the day was to implement the Add Project component to allow the admin to create and assign projects to users.

2. Tasks Performed

- Designed the Add Project form with fields such as project name, description, and assigned user
- Implemented the form using Angular Reactive Forms
- Retrieved user list from Firestore to populate assignment options
- Captured project details along with selected user
- Connected the form with Firestore to store project data
- Linked each project with a specific user using user ID/reference
- Displayed confirmation after successful project creation
- Tested project assignment with multiple users

3. Tools / Technologies Used

- Angular Framework
- Firebase Firestore
- AngularFire
- Reactive Forms

- TypeScript

4. Key Learnings

- Projects can be dynamically assigned to users through admin panel
- Proper data linking ensures accurate project-user mapping
- Reactive Forms help manage structured input and validation
- Firestore supports relational-like data through references
- Admin control enables centralized project management

5. Challenges Faced

- Ensuring correct assignment of projects to selected users
- Handling data consistency between users and projects

6. Solutions

- Used user identifiers (IDs) for accurate mapping
- Verified stored data in Firestore after each submission

7. Conclusion

- Successfully implemented Add Project functionality
- Enabled admin to assign projects to users effectively
