6 Months Training TR-104 Full Stack Development

February, 2026

Day 3 – Firebase Introduction and Backend Services

1. Objective of the Day

The objective of the day was to understand Firebase as a backend service and explore its role in authentication and data storage within the application.

2. Tasks Performed

- Studied the overview of Firebase as a Backend-as-a-Service (BaaS) platform
- Explored Firebase Authentication for managing user accounts
- Understood the role of Firestore as a NoSQL cloud database
- Analyzed how Firebase handles authentication and data storage
- Studied how Firebase manages user sessions and authentication state
- Reviewed Firebase console interface and configuration settings
- Understood how Firebase integrates with modern web applications

3. Tools / Technologies Used

- Firebase
- Angular Framework
- Web Browser

4. Key Learnings

- Firebase provides backend services without server-side coding
- Firebase Authentication handles user login and signup securely
- Firestore is used for storing application data

- Firebase simplifies backend development for web applications
- Authentication and database services are tightly integrated

5. Challenges Faced

- Understanding Firebase services and their roles
- Differentiating between authentication and database functionalities

6. Solutions

- Studied Firebase documentation and console features
- Analyzed use cases of each Firebase service

7. Conclusion

- Gained clear understanding of Firebase backend services
- Understood how Firebase supports authentication and data storage
