6 Months Training TR-104 Full Stack Development

February, 2026

Day 4 – AngularFire Integration and Configuration

1. Objective of the Day

The objective of the day was to integrate Firebase with the Angular application using AngularFire and configure the environment for backend communication.

2. Tasks Performed

- Installed AngularFire and Firebase packages in the Angular project
- Configured Firebase credentials in the Angular environment files
- Initialized Firebase within the Angular application
- Integrated AngularFire services for authentication operations
- Verified successful connection between Angular and Firebase
- Tested basic Firebase functionality within the application
- Ensured no runtime errors during integration

3. Tools / Technologies Used

- Angular Framework
- Firebase
- AngularFire
- TypeScript

4. Key Learnings

- AngularFire acts as a bridge between Angular and Firebase
- Proper configuration is required for successful integration

- Environment files store Firebase credentials securely
- Angular applications can communicate directly with Firebase services
- Integration enables real-time backend interaction

5. Challenges Faced

- Configuration issues during Firebase setup
- Ensuring compatibility between Angular and Firebase versions

6. Solutions

- Followed official AngularFire setup documentation
- Verified configuration step-by-step

7. Conclusion

- Successfully integrated Firebase with Angular application
- Established backend connectivity using AngularFire
