6 Months Training TR-104 Full Stack Development

February, 2026

Day 5 – Signup Flow Implementation

1. Objective of the Day

The objective of the day was to implement the user signup functionality and understand how user credentials are sent from the Angular frontend to Firebase Authentication.

2. Tasks Performed

- Designed the signup form with email and password fields
- Implemented the form using Angular Reactive Forms
- Captured user input through form controls
- Connected the signup form with Firebase authentication service
- Sent user credentials (email and password) to Firebase
- Triggered account creation using Firebase authentication methods
- Handled form submission and response flow
- Displayed success and error messages based on signup result
- Ensured validation rules were applied before submission

3. Tools / Technologies Used

- Angular Framework
- Firebase Authentication
- AngularFire
- Reactive Forms

- TypeScript

4. Key Learnings

- Signup process involves sending user data to backend authentication service
- Firebase handles user account creation securely
- Reactive Forms help manage form structure and validation
- Proper validation ensures correct data submission
- UI feedback improves user experience during signup

5. Challenges Faced

- Handling asynchronous signup requests
- Managing validation and error messages correctly

6. Solutions

- Implemented structured form handling
- Tested different input cases for validation

7. Conclusion

- Successfully implemented user signup functionality
- Established connection between frontend form and Firebase authentication
