6 Months Training TR-104 Full Stack Development

February, 2026

Day 6 – Firebase Authentication Processing and Validation

1. Objective of the Day

The objective of the day was to understand how Firebase processes authentication requests and handles validation during user account creation.

2. Tasks Performed

- Analyzed how Firebase validates email and password during signup
- Observed Firebase response for successful and failed signup attempts
- Handled errors such as invalid email format and weak passwords
- Studied Firebase authentication error codes and messages
- Implemented error handling in the application
- Displayed meaningful feedback to users based on Firebase responses
- Tested multiple signup scenarios to verify validation behavior
- Ensured proper communication between frontend and Firebase

3. Tools / Technologies Used

- Firebase Authentication
- Angular Framework
- AngularFire
- TypeScript

4. Key Learnings

- Firebase automatically validates user credentials

- Error handling is essential for user-friendly applications
- Authentication responses must be handled properly in frontend
- Firebase provides detailed error messages for debugging
- Validation ensures secure and reliable account creation

5. Challenges Faced

- Understanding different Firebase error responses
- Handling edge cases during signup

6. Solutions

- Tested multiple invalid input scenarios
- Mapped Firebase errors to user-friendly messages

7. Conclusion

- Successfully understood Firebase authentication processing
- Implemented effective validation and error handling
