Day 10 – Testing and Validation of Admin and User Panel Functionality

1. Objective of the Day

The objective of the day was to test all functionalities of the admin and user panels and ensure correct system behavior across different scenarios.

2. Tasks Performed

- Tested user creation functionality from admin panel
- Verified project assignment to different users
- Tested project visibility in user panel for respective users
- Checked role-based access control for admin and normal users
- Validated data consistency between Firestore and UI
- Tested navigation flow between login, admin panel, and user panel
- Identified and fixed minor issues during testing
- Re-tested functionalities after applying fixes

3. Tools / Technologies Used

- Angular Framework
- Firebase Authentication
- Firebase Firestore
- AngularFire
- Web Browser

4. Key Learnings

- Testing ensures reliability of implemented features
- Data consistency is critical for correct application behavior
- Role-based access must be validated thoroughly
- Integration testing helps identify real-world issues
- Continuous testing improves system stability

5. Challenges Faced

- Identifying edge cases across admin and user functionalities
- Ensuring consistent behavior across different user roles

6. Solutions

- Performed multiple test scenarios with different user accounts
- Fixed issues and validated functionality after corrections

7. Conclusion

- Successfully tested and validated admin and user panel features
- Ensured stable and correct system behavior
